GLA UNIVERSITY

Department of Computer Engineering & Applications

MINI PROJECT – 1 SYNOPSIS

1. BASIC PROJECT DETAILS

Project Title	Freelance Marketplace & Dispute Board
Batch No.	9
Section	3SA
Semester	V
Date of Submission	18/09/2026
Faculty Mentor / Guide	Mr. Satyam Kumar Jha

2. TEAM MEMBERS & ROLES

S.No.	Name of Student	University Roll No.	Role in Project
1	Sujal Singh	2415001611	Milestone Escrow & Payment Tracker
2	Suraj Kumar Thakur	2415001634	Marketplace & Bidding Module
3	Trimohan Chauhan	2415001688	Shared State, Integration & QA
4	Uddalak	2415001695	Dispute Resolution Board

3. PROJECT DESCRIPTION

The Freelance Marketplace & Dispute Board is a browser-based frontend prototype designed to demonstrate the major workflows of a digital freelancing platform. The project addresses the need for a structured interface where clients can explore projects, freelancers can submit proposals, and users can track progress through milestone-based payment stages. It includes a proposal and bidding flow, a simulated milestone-escrow tracker with animated release states, and a dispute-resolution board for viewing evidence and modeling case-status transitions. All project records, proposals, milestones, and disputes are represented through a bundled dataset, while JavaScript manages client-side state and updates the interface according to user interactions. HTML is used for semantic structure, CSS for responsive design and visual animations, and JavaScript for DOM manipulation, event handling, and workflow simulation. The prototype does not process real payments, use a live backend, or deliver legally binding dispute decisions. Instead, it provides an educational demonstration of how marketplace, escrow-tracking, and dispute-management modules can be integrated into one interactive web application.

4. OBJECTIVES & PROPOSED WORK (WHAT WE ARE GOING TO DO)

• **Develop a responsive freelance marketplace interface using React and CSS3:** Build an intuitive, cross-device catalog for exploring and browsing freelance project listings.
• **Implement a simulated proposal and bidding workflow:** Handle proposal submissions, quote inputs, and freelancer bid placements through modular React state.
• **Design an animated milestone-escrow tracker:** Create visual status indicators and CSS animations to represent payment stages, including *pending*, *funded*, *in progress*, and *released*.
• **Create an interactive dispute-resolution board:** Build views for inspecting case evidence and triggering case-status transitions (e.g., *Under Review*, *Resolved*)..
• **Manage client-side state using a bundled mock dataset:** Keep all project records, proposals, escrow milestones, and dispute cases synchronized across components without a live backend.
• **Current Stage:** Requirement gathering, component hierarchy planning, and frontend prototype implementation are being carried out in iterative stages.

5. FUTURE SCOPE / ENHANCEMENTS

• **Backend Integration:** Connect a real backend using Node.js and Express.js instead of using mock data.
• **Database Support:** Add MySQL or MongoDB so projects, proposals, and user data are permanently saved.
• **User Login & Roles:** Add login and signup pages with separate accounts for clients, freelancers, and admins.
• **Real Payment Gateway:** Connect payment services like Stripe or Razorpay to handle actual payments and escrow safely.
• **Live Chat & Notifications:** Add real-time messaging between clients and freelancers, along with file sharing and status alerts.
• **Admin Review System:** Build an admin panel where an authorized person can review evidence and settle disputes between users.

6. TOOLS & TECHNOLOGIES USED

• **React.js:** Building reusable UI components, handling user interactions, and managing screen state.

• **HTML5 & CSS3:** Page structure, responsive design, and status transition animations.

• **JavaScript (ES6+):** Component logic, event handling, and workflow simulation.

• **Bundled Dataset (JSON):** Mock data for sample projects, proposals, escrow milestones, and dispute cases.

• **Web Browser:** Running, testing, and demonstrating the prototype application.

7. EXPECTED OUTCOME

A fully working frontend prototype of a freelance marketplace built with React. Users can browse projects, submit simulated bids, track milestone payments with animations, and view dispute cases with evidence logs. All data updates dynamically on the screen using a mock dataset, providing a clean, responsive interface that can be connected to a real backend in the future.
